

# What's *really* causing your headaches?

**Dr. Jeff Danner**

Headaches, facial pain, even neck and shoulder pain can all be caused by temporomandibular disorders. Determining the extent of these issues and how they affect an individual can only be properly diagnosed with a **Neuromuscular Dental Evaluation**.

A computerized instrument called the **K7** allows us to scan and track jaw movement and offers an objective evaluation of these muscles. This new dental technology has helped many patients who were unable to find relief from this type of pain.

Because the facial muscles of the forehead play an important role in the posturing and closing of the jaw, research indicates that abnormal tension in these muscles is often the cause of headaches and other types of pain. Effective treatments which relax muscles and reposition the jaw have proven extremely successful for patients in our practice.

*"Before this treatment, I had no idea how much pain I was just living with every day,"* according to one of our patients who is no longer experiencing these types of headaches (and smiling more!).

To find out if your headaches can be eliminated through neuromuscular dentistry, please complete a simple checklist on our website and call our office for a **free evaluation with the K7 computerized system**. Offer valid through 7/7/07.
